# Structure Learning

## Road Map

- Basics of Probability and Statistical Estimation
- Bayesian Networks
- Markov Networks
- Inference
- Learning
  - Parameters, Structure, EM
- HMMs

- Hard problem
  - Finding the BN structure with the highest "score" among those
    structures with at most k parents is NP hard for k>1 (Chickering, 1995)
- Inputs
  - Data (potentially incomplete)
- Outputs
  - Graphical model structure (we'll focus on Bayes Nets)
- Approaches
  - Constraint-based
  - Score-based approaches
    - Local search
  - Bayesian Model Averaging

- Hard problem
  - Finding the BN structure with the highest "score" among those
    structures with at most k parents is NP hard for k>1 (Chickering, 1995)
- Inputs
  - Data (potentially incomplete)
- Outputs
  - Graphical model structure (we'll focus on Bayes Nets)
- Approaches
  - Constraint-based
  - Score-based approaches
    - Local search
  - Bayesian Model Averaging

### Constraint-based Approaches

- Idea: we know how to construct a Bayes Net if we can perform independence tests
  - $(A \perp B \mid C)$ ?
- Naïve construction
  - depends on variable ordering
  - Issues potentially large independence queries
- A more sophisticated PDAG construction process works better (see book)

#### Constraint-based approach guarantees

- Can uncover a perfect map using a polynomial # of tests if:
  - Bounded in-degree d in G\* (true graph)
  - Perfect independence queries up to size 2d + 2 (Strong)
  - P\* (true dist.) is *faithful* to G\*(Also strong)
    - i.e., any independencies in P\* reflected as d-separation in G\*

- Approaches
  - Constraint-based
  - Score-based approaches
    - Local search
  - Bayesian Model Averaging

### **Scoring Structures**

- Maximum likelihood G
  - Choose  $G = \arg \max_{G} \max_{\theta} P(Data \mid \theta)$
- Or MAP:
  - Choose  $G = \arg \max_{G} \max_{\theta} P(Data \mid \theta) P(\theta)$

...what's wrong with these?

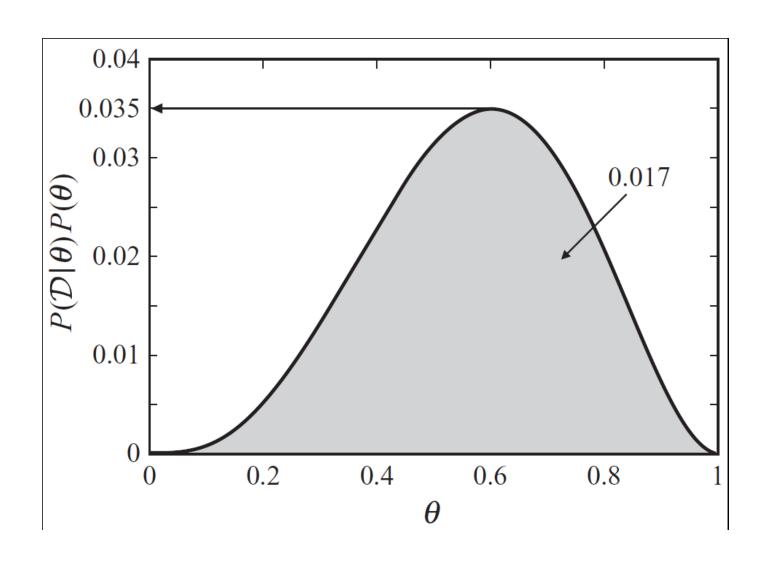

### Bayesian Score

Bayesian Score for G = prior for G

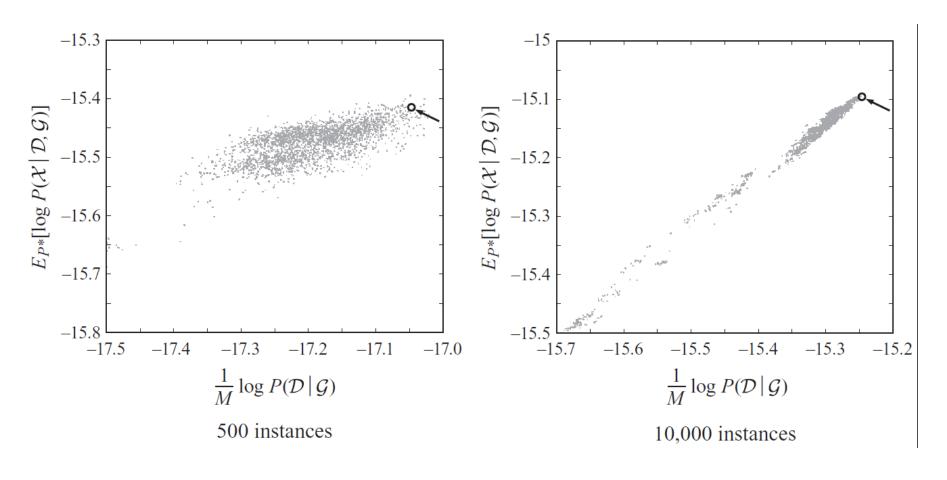

likelihood integrated over all parameters for G

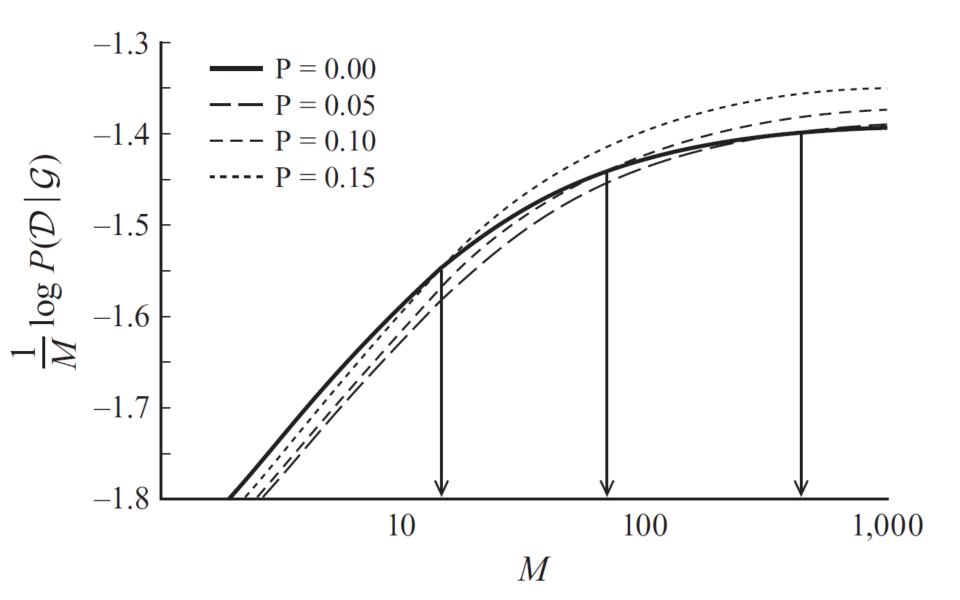

- BayesianScore(G: Data) = log P(Data | G) + log P(G)
- P(Data | G) =  $\int_{\Theta_G} P(Data | \theta_G, G) P(\theta_G | G) d\theta_G$

#### Integrating over parameters

#### Training (x-axis) vs. Test (y-axis) Perf.

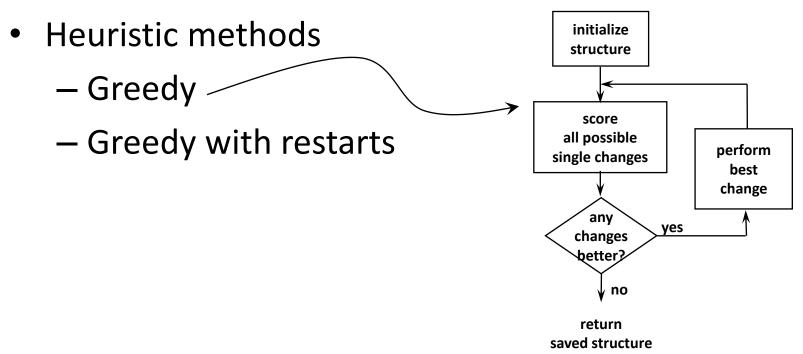

## **Bayesian Information Criterion**

- Bayes Score includes:
  - P(Data | G) =  $\int_{\Theta_G}$  P(Data |  $\theta_G$ , G) P( $\theta_G$  | G) d $\theta_G$
- Integral sometimes difficult
- Approximation:

$$score_{BIC}(G) = -(Dim[G]/2) log M + log max_{\theta_G} P(Data | \theta_G)$$

#### Structure search

 Finding the BN structure with the highest score among those structures with at most k parents is NP hard for k>1 (Chickering, 1995)

#### Structure priors

- Lots of options
  - All possible structures equally likely
  - Partial ordering, required / prohibited arcs
  - Prior(G)  $\alpha$  Similarity(G, Gprior)

- Approaches
  - Constraint-based
  - Score-based approaches
    - Local search
  - Bayesian Model Averaging

## Bayesian Model Averaging

Previous methods all find a single graph G

 Bayesian model averaging instead makes predictions by averaging over structures:

```
P(test example | Data) = \sum_{G} P(\text{test example | Data}, G) P(G | Data)
```
