# Basics of Probability 

## Events

- Event space $\Omega$
- E.g. for dice, $\Omega=\{1,2,3,4,5,6\}$
- Set of measurable events $S \subseteq 2^{\Omega}$

- E.g.,
$\alpha=$ event we roll an even number $=\{2,4,6\} \in S$
- $S$ must:
- Contain the empty event $\varnothing$ and the trivial event $\Omega$
- Be closed under union \& complement
$\square \alpha, \beta \in S \rightarrow \alpha \cup \beta \in S \quad$ and $\quad \alpha \in S \rightarrow \Omega-\alpha \in S$

## Probability Distributions

- A probability distribution $P$ over $(\Omega, S)$ is a mapping from $S$ to real values such that:
I. $P(\alpha) \geq 0 \quad \forall \alpha \in S \quad \begin{aligned} \text { Sidenote }- \text { Ist and } 3 \text { rd axioms } \\ \text { 2. } P(\Omega)=1 \\ \text { 3. } \alpha, \beta \in S\end{aligned} \quad \alpha \cap \beta=\varnothing \rightarrow P(\alpha \cup \beta)=P(\alpha)+P(\beta)$

## Probability Distributions

Can visualize probability as fraction of area

## Probability: Interpretations \& Motivation

- Interpretations: Frequentist vs. Bayesian
- Why use probability for subjective beliefs?
- Beliefs that violate the axioms can lead to bad decisions regardless of the outcome [de Finetti, 193I]
- Example: $P(A)=0.6, P(\operatorname{not} A)=0.8$ ?
- Example: $P(A)>P(B)$ and $P(B)>P(A)$ ?

## Random Variables

- A random variable is a function from $\Omega$ to a value
- A partition of the event space $\Omega$
- A short-hand for referring to attributes of events
- Examples
- $\Omega=\{1,2,3,4,5,6\}$
$=\operatorname{Val}($ DieRollEven $)$
DieRollEven $\in\{$ true, false $\}$
- $\Omega=$ \{all possible hmwk/exam grade combinations\}

FinalGrade $\in\{a, b, c\}$

## Joint Distributions

| Grade | Interest | Course load | $P(C, 1, C)$ |
| :---: | :---: | :---: | :---: | :---: |
| a | high | full-time | 0.10 |
| a | high | part-time | 0.08 |
| a | low | full-time | 0.03 |
| a | low | part-time | 0.04 |
| b | high | full-time | 0.07 |
| b | high | part-time | 0.02 |
| b | low | full-time | 0.12 |
| b | low | part-time | 0.16 |
| c | high | full-time | 0.01 |
| c | high | part-time | 0.02 |
| c | low | full-time | 0.20 |
| c | low | part-time | 0.15 |

## Conditioning!

## Conditioning!

| Grade | Interest | Course load | $P(G, 1, C)$ |
| :---: | :---: | :---: | :---: |
| a | high | full-time | $0.10 / 0.53$ |
| a | low | full-time | $0.03 / 0.53$ |
| b | high | full-time | $0.07 / 0.53$ |
| b | low | full-time | $0.12 / 0.53$ |
| c | high | full-time | $0.01 / 0.53$ |
| c | low | full-time | $0.20 / 0.53$ |

## Conditioning!

| Grade | Interest | Course load | $P(\mathbb{C}, \\| C=1)$ |
| :---: | :---: | :---: | :---: |
| a | high | full-time | 0.21 |
| a | low | full-time | 0.09 |
| b | high | full-time | 0.14 |
| b | low | full-time | 0.09 |
| c | high | full-time | 0.26 |
| c | low | full-time | 0.21 |

## Conditional Probability

- $\mathrm{P}($ Grade $=\mathrm{A} \mid$ Interest $=\mathrm{High})=0.6$
> the probability of getting an A given only Interest $=$ High, and nothing else.
- If we know Motivation = High or OtherInterests = Many, the probability of an A changes even given high Interest
- Formal Definition:

$$
\begin{aligned}
& \quad \mathrm{P}(\alpha \mid \beta)=\mathrm{P}(\alpha, \beta) / \mathrm{P}(\beta) \\
& \quad \text { When } \mathrm{P}(\beta)>0
\end{aligned}
$$

## Conditional Probability

- Also:
- $P(A \mid B, C)=P(A, B, C) / P(B, C)$
- More generally:
> $P(A \mid B)=P(A, B) / P(B)$
- (Boldface indicates vectors of variables)
- P(Grade = A | Grade = A, Interest = high) ?

## Marginalization

| Grade | Interest | Course load | $P(G), C)$, |
| :---: | :---: | :---: | :---: |
| a | high | full-time | 0.10 |
| a | high | part-time | 0.08 |
| a | low | full-time | 0.03 |
| a | low | part-time | 0.04 |
| b | high | full-time | 0.07 |
| b | high | part-time | 0.02 |
| b | low | full-time | 0.12 |
| b | low | part-time | 0.16 |
| c | high | full-time | 0.01 |
| c | high | part-time | 0.02 |
| c | low | full-time | 0.20 |
| c | low | part-time | 0.15 |

## Marginalization

| Grade | Interest | Course load | $P(G, 1, C)$ |
| :---: | :---: | :---: | :---: |
| a | high | $*$ | 0.10 |
| a | high | $*$ | 0.08 |
| a | low | $*$ | 0.03 |
| a | low | $*$ | 0.04 |
| b | high | $*$ | 0.07 |
| b | high | $*$ | 0.02 |
| b | low | $*$ | 0.12 |
| b | low | $*$ | 0.16 |
| c | high | $*$ | 0.01 |
| c | high | $*$ | 0.02 |
| c | low | $*$ | 0.20 |
| c | low | $*$ | 0.15 |

## Marginalization

| Grade | Interest | Course load | $P(G, 1)$ |
| :---: | :---: | :---: | :---: |
| a | high | $*$ | 0.18 |
| a | low | $*$ | 0.07 |
| b | high | $*$ | 0.09 |
| b | low | $*$ | 0.28 |
| c | high | $*$ | 0.03 |
| c | low | $*$ | 0.35 |

## Marginalization

| Grade | Interest | $P(G, D)$ |
| :---: | :---: | :---: |
| a | high | 0.18 |
| a | low | 0.07 |
| b | high | 0.09 |
| b | low | 0.28 |
| c | high | 0.03 |
| c | low | 0.35 |

## Marginalization

$$
P(X)=\sum_{y \in \operatorname{Val}(Y)} P(X, Y=y)
$$

## Continuous Random Variables

- For continuous r.v. $X$, specify a density $p(x)$, such that:

$$
\begin{aligned}
& \text { E.g., } P(r \leq X \leq s)=\int_{x=r}^{s} p(x) d x \\
& p(x)=\left\{\begin{array}{cl}
\frac{1}{b-a} & b \geq x \geq a^{\frac{1}{b-a}} \\
0 & \text { otherwise }
\end{array}\right.
\end{aligned}
$$

## Uniform Continuous Density

## Gaussian Density

- $p(x)=$

$$
\frac{1}{\sqrt{2 \pi \sigma^{2}}} \exp \left(-\frac{(x-\mu)^{2}}{2 \sigma^{2}}\right)
$$

## Joint Distribution

Joint Distribution specified with $2 * 3-I=5$ values

## Conditional Probability

|  |  | Interest |  |
| :---: | :--- | :--- | :--- |
|  |  | low | high |
| Grade | a | 0.07 | 0.18 |
|  | b | 0.28 | 0.09 |
|  | c | 0.35 | 0.03 |

$\mathrm{P}($ Grade $=\mathrm{a} \mid$ Interest $=$ high $)$ ?
$\mathrm{P}($ Grade $=$ a, Interest $=$ high $)=0.18$
$\mathrm{P}($ Interest $=$ high $)=0.18+0.09+0.03=0.30$
$=>P($ Grade $=\mathrm{a} \mid$ Interest $=$ high $)=0.18 / 0.30=0.6$

## Conditional Probability

|  |  | Interest |  |
| :---: | :--- | :--- | :--- |
|  |  | low | high |
|  | a | 0.07 | 0.18 |
| Grade | b | 0.28 | 0.09 |
|  | c | 0.35 | 0.03 |

P(Interest | Grade = a)?

|  | Interest |
| :--- | :--- |
| low | high |
| 0.28 | 0.72 |

## Conditional Probability

P(Interest | Grade)?
Actually three separate distributions, one for each Grade value
(has three independent parameters total)

## Chain Rule

$$
\begin{aligned}
& \mathrm{P}\left(X_{1}=x_{1}, \ldots, X_{n}=x_{n}\right)= \\
& \qquad \prod_{i=1}^{n} \mathrm{P}\left(X_{i}=x_{i} \mid X_{i-1}=x_{i-1}, \ldots, X_{1}=x_{1}\right)
\end{aligned}
$$

- E.g., P(Grade=b, Int. = high)

$$
=\mathrm{P}(\text { Grade }=\mathrm{b} \mid \text { Int. }=\text { high }) \mathrm{P}(\text { Int. }=\text { high })
$$

Can be used for distributions...

- $P(A, B)=P(A \mid B) P(B)$

## Handy Rules for Cond. Probability (1 of 2)

- $P(A \mid B=b)$ is a single distribution, like $P(A)$
- $P(A \mid B)$ is not a single distribution
- a set of $|\mathrm{Val}(B)|$ distributions

## Handy Rules for Cond. Probability (2 of 2)

- Any statement true for arbitrary distributions is also true if you condition on a new r.v.
- $P(A, B)=P(A \mid B) P(B)$ ? (chain rule)

Then also $P(A, B \mid C)=P(A \mid B, C) P(B \mid C)$

- Likewise, any statement true for arbitrary distributions is also true if you replace an r.v. with two/more new r.v.s
- $P(A \mid B)=P(A, B) / P(B)$ ? (def. of cond. Prob)
- $P(A \mid C, D)=P(A, C, D) / P(C, D)$ or $P(A \mid B)=P(A, B) / P(B)$

## Independence

- P (Rain | Cloudy) $=\mathrm{P}$ (Rain)
- But: P(FairDie=6 | PreviousRoll=6) $=\mathrm{P}($ FairDie=6 $)$
- We say $A$ and $B$ are independent iff

$$
P(A \mid B)=P(A)
$$

- Logically equivalent to $P(A, B)=P(A) * P(B)$
- Denoted $A \perp B$

## Conditional Independence (1 of 2)

- $A$ and $B$ are conditionally independent given $C$ iff

$$
P(A \mid B, C)=P(A \mid C)
$$

- Equivalent to $P(A, B \mid C)=P(A \mid C) P(B \mid C)$
- Denoted $(A \perp B \mid C)$

## Conditional Independence (2 of 2)

- Example: university admissions
- Val(GetIntoX) = \{yes, no, wait\}
- $\operatorname{Val}($ Application $)=\{$ good, bad $\}$
$3 * 3 * 2 * 2=36$ Parameters
P(GetIntoNU | GetIntoUIUC, GetIntoStanford, Application)

P(GetIntoNU | Application)
2*2=4 Parameters

## Properties of Conditional Independence

- Decomposition

$$
\text { , } \mathbf{X} \perp \mathbf{Y}, \mathbf{W} \mid \boldsymbol{Z})=>(X \perp \mathbf{Y} \mid \boldsymbol{Z})
$$

- Weak Union

$$
(X \perp Y, W \mid Z)=>(X \perp Y \mid Z, W)
$$

- Contraction
- $(X \perp W \mid Z, Y) \&(X \perp Y \mid Z)=>(X \perp Y, W \mid Z)$

## Expectation

- Discrete

$$
E_{P}[X]=\sum_{x} x P(x)
$$

- Continuous

$$
E_{P}[X]=\int x p(x) d x
$$

- E.g., E[FairDie]=3.5

## Expectation is Linear

$$
\begin{aligned}
& \quad \begin{array}{l}
E_{P}[X+Y]=\sum_{x, y}(x+y) P(x, y) \\
\quad=\sum_{x, y} x P(x, y)+\sum_{x, y} y P(x, y) \\
\quad=\sum_{x} x \sum_{y} P(x, y)+\sum_{y} y \sum_{x} P(x, y) \\
\quad=\sum_{x} x P(x)+\sum_{y} y P(y)=E_{P}[X]+E_{P}[Y]
\end{array}
\end{aligned}
$$

## What have we learned?

- Probability - a calculus for dealing with uncertainty
, Built from small set of axioms (ignore at your peril)
- Joint Distribution P(A, B, C, ...)
, Specifies probability of all combinations of r.v.s
- Conditional Probability P(A $\operatorname{B})$
- Specifies probability of $A=$ a given $B=b$
- Conditional Independence
- Can radically reduce number of model parameters
- Expectation
- Next time: Bayes' Rule, Statistical Estimation
