

# Review and Announcement

- ❑ Ethernet
  - Ethernet CSMA/CD algorithm
- ❑ Hubs, bridges, and switches
  - Hub: physical layer
    - Can't interconnect 10BaseT & 100BaseT
  - Bridges and switches: data link layers
- ❑ Wireless links and LANs
  - 802.11 a, b, g.
  - All use CSMA/CA for multiple access
- ❑ Homework 4 due tonight so that TA can discuss it in recitation tomorrow
- ❑ Final review in Thu. class

# Network Security Overview

- ❑ What is network security?
- ❑ Principles of cryptography
- ❑ Authentication
- ❑ Access control: firewalls
- ❑ Attacks and counter measures
  
- ❑ Part of the final

# What is network security?

**Confidentiality:** only sender, intended receiver should "understand" message contents

- sender encrypts message
- receiver decrypts message

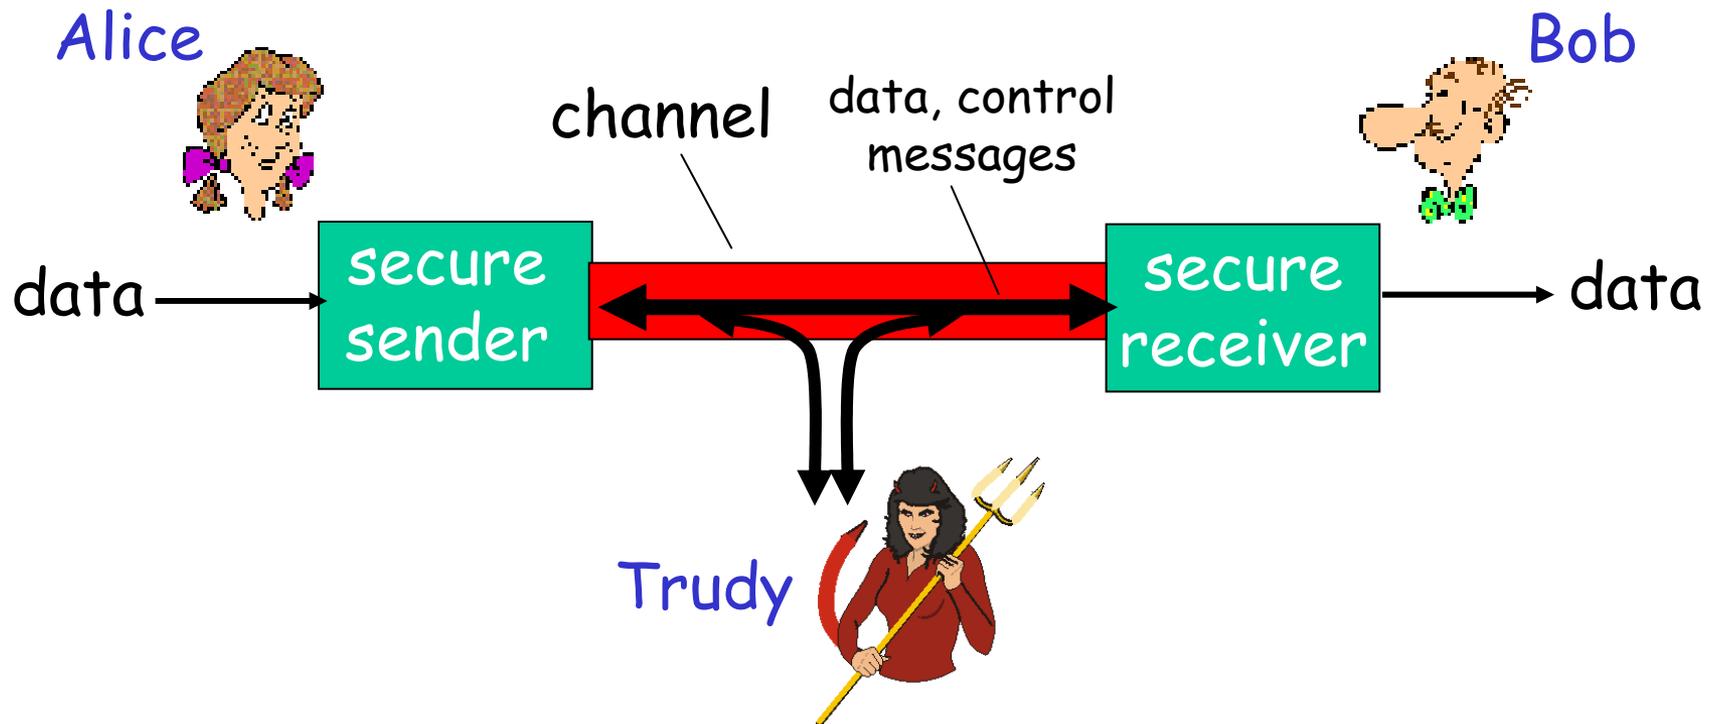

**Authentication:** sender, receiver want to confirm identity of each other

**Message Integrity:** sender, receiver want to ensure message not altered (in transit, or afterwards) without detection

**Access and Availability:** services must be accessible and available to users

# Friends and enemies: Alice, Bob, Trudy

- well-known in network security world
- Bob, Alice (lovers!) want to communicate "securely"
- Trudy (intruder) may intercept, delete, add messages

# Who might Bob, Alice be?

- ❑ ... well, *real-life* Bobs and Alices!
- ❑ Web browser/server for electronic transactions (e.g., on-line purchases)
- ❑ on-line banking client/server
- ❑ DNS servers
- ❑ routers exchanging routing table updates
- ❑ other examples?

# There are bad guys (and girls) out there!

Q: What can a "bad guy" do?

A: a lot!

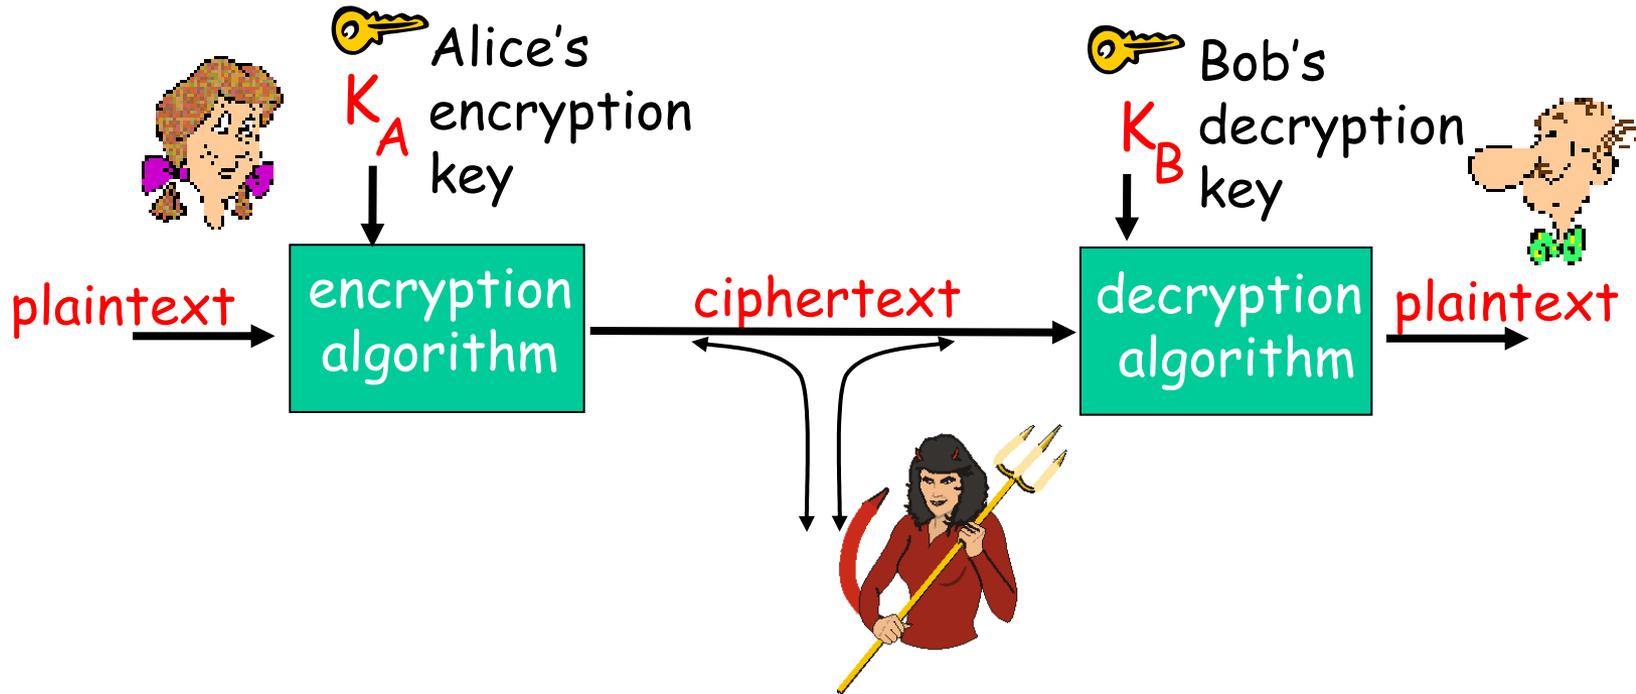

- *eavesdrop*: intercept messages
- actively *insert* messages into connection
- *impersonation*: can fake (spoof) source address in packet (or any field in packet)
- *hijacking*: "take over" ongoing connection by removing sender or receiver, inserting himself in place
- *denial of service*: prevent service from being used by others (e.g., by overloading resources)

*more on this later .....*

# Overview

- ❑ What is network security?
- ❑ Principles of cryptography
- ❑ Authentication
- ❑ Access control: firewalls
- ❑ Attacks and counter measures

# The language of cryptography

**symmetric key** crypto: sender, receiver keys *identical*  
**public-key** crypto: encryption key *public*, decryption key *secret* (private)

# Public Key Cryptography

## symmetric key crypto

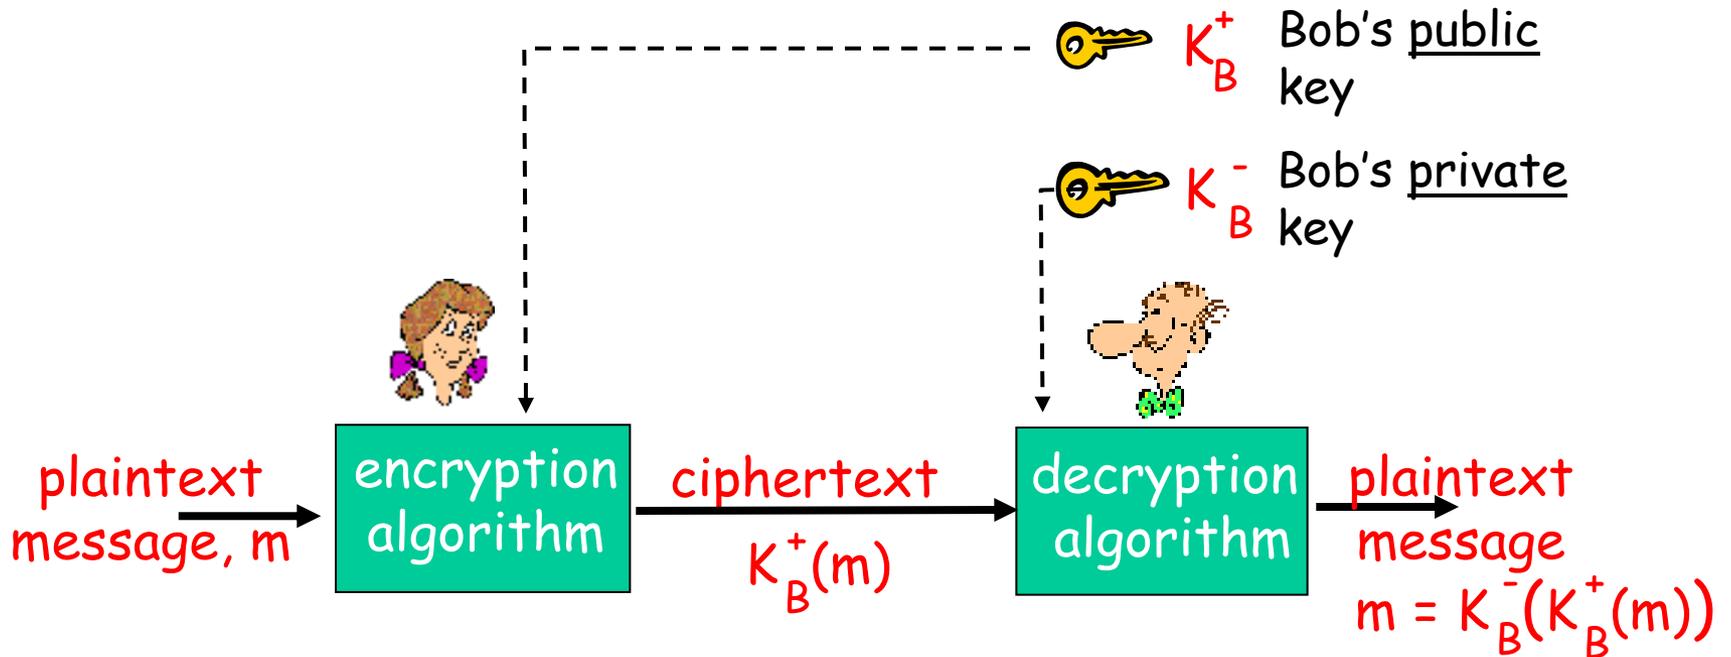

- ❑ requires sender, receiver know shared secret key
- ❑ Q: how to agree on key in first place (particularly if never "met")?

## public key cryptography

- ❑ radically different approach [Diffie-Hellman76, RSA78]
- ❑ sender, receiver do *not* share secret key
- ❑ *public* encryption key known to *all*
- ❑ *private* decryption key known only to receiver

# Public key cryptography

# Public key encryption algorithms

Requirements:

① need  $K_B^+(\cdot)$  and  $K_B^-(\cdot)$  such that

$$K_B^-(K_B^+(m)) = m$$

② given public key  $K_B^+$ , it should be impossible to compute private key  $K_B^-$

**RSA:** Rivest, Shamir, Adelson algorithm

# Overview

- ❑ What is network security?
- ❑ Principles of cryptography
- ❑ Authentication
- ❑ Access control: firewalls
- ❑ Attacks and counter measures

# Authentication

Goal: Bob wants Alice to "prove" her identity to him

Protocol ap1.0: Alice says "I am Alice"

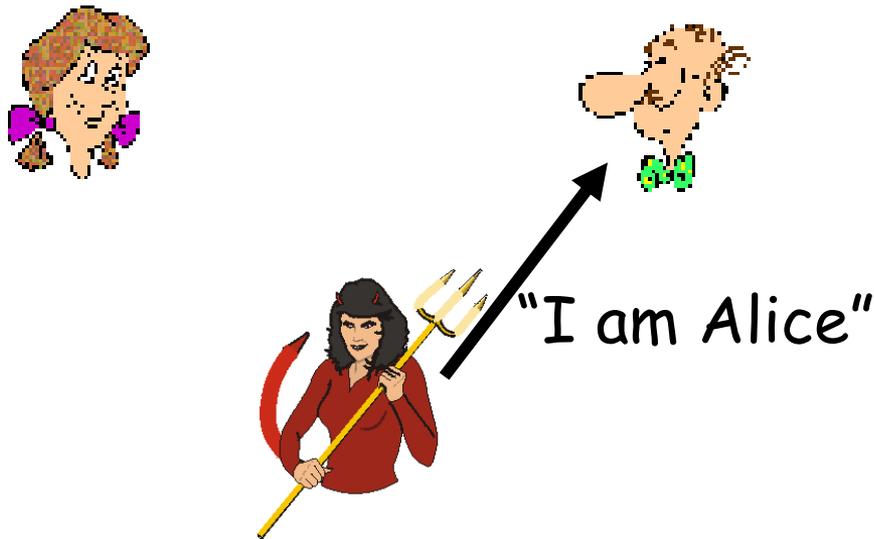

Failure scenario??

# Authentication

Goal: Bob wants Alice to "prove" her identity to him

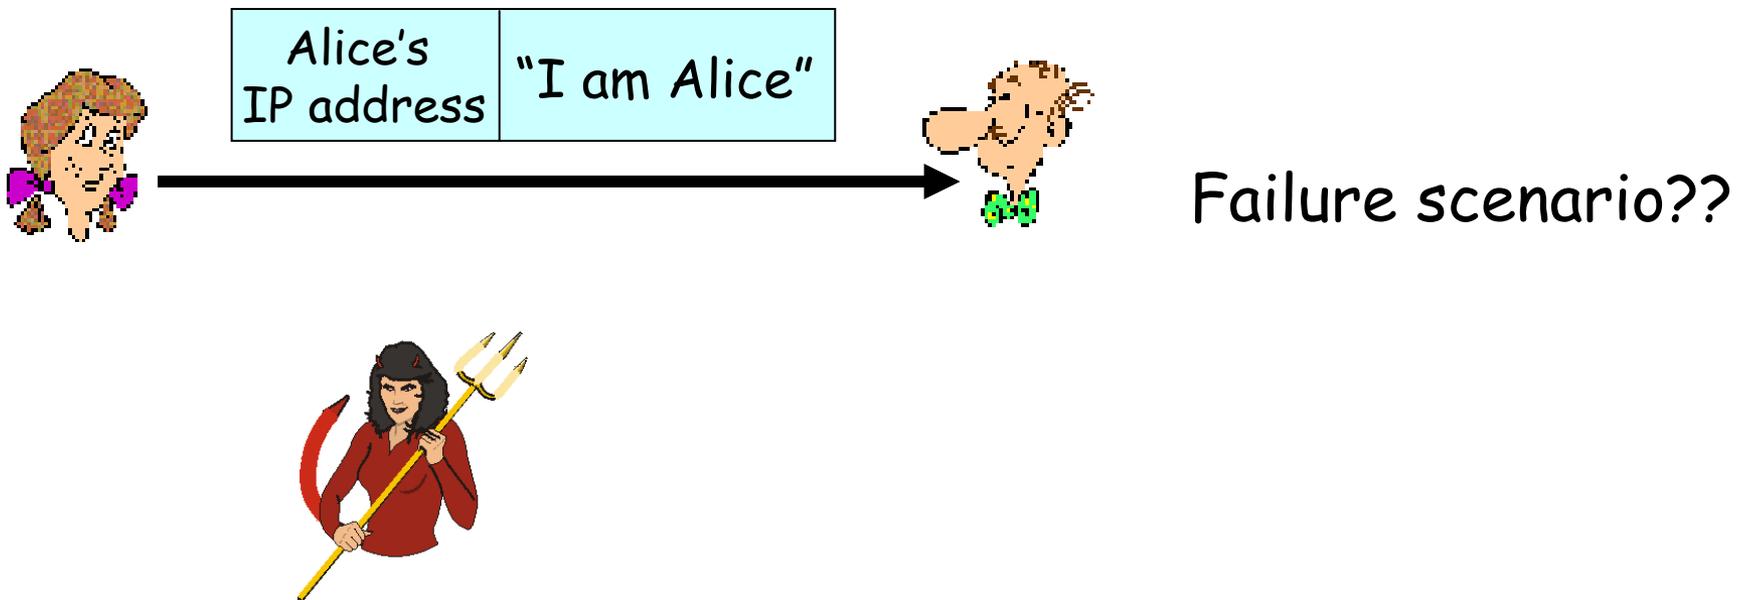

Protocol ap1.0: Alice says "I am Alice"

in a network,  
Bob can not "see"  
Alice, so Trudy simply  
declares  
herself to be Alice

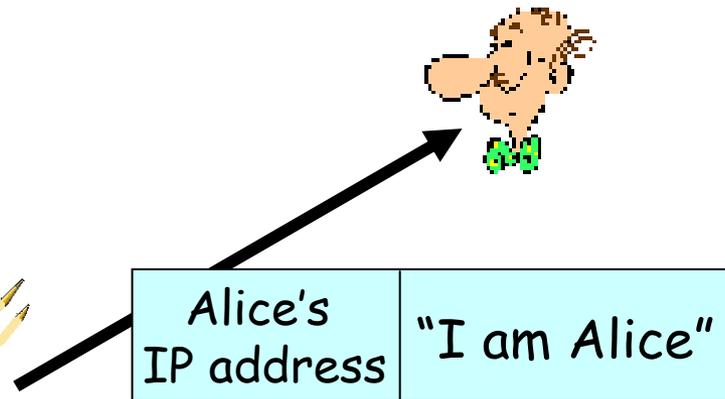

# Authentication: another try

Protocol ap2.0: Alice says "I am Alice" in an IP packet containing her source IP address

# Authentication: another try

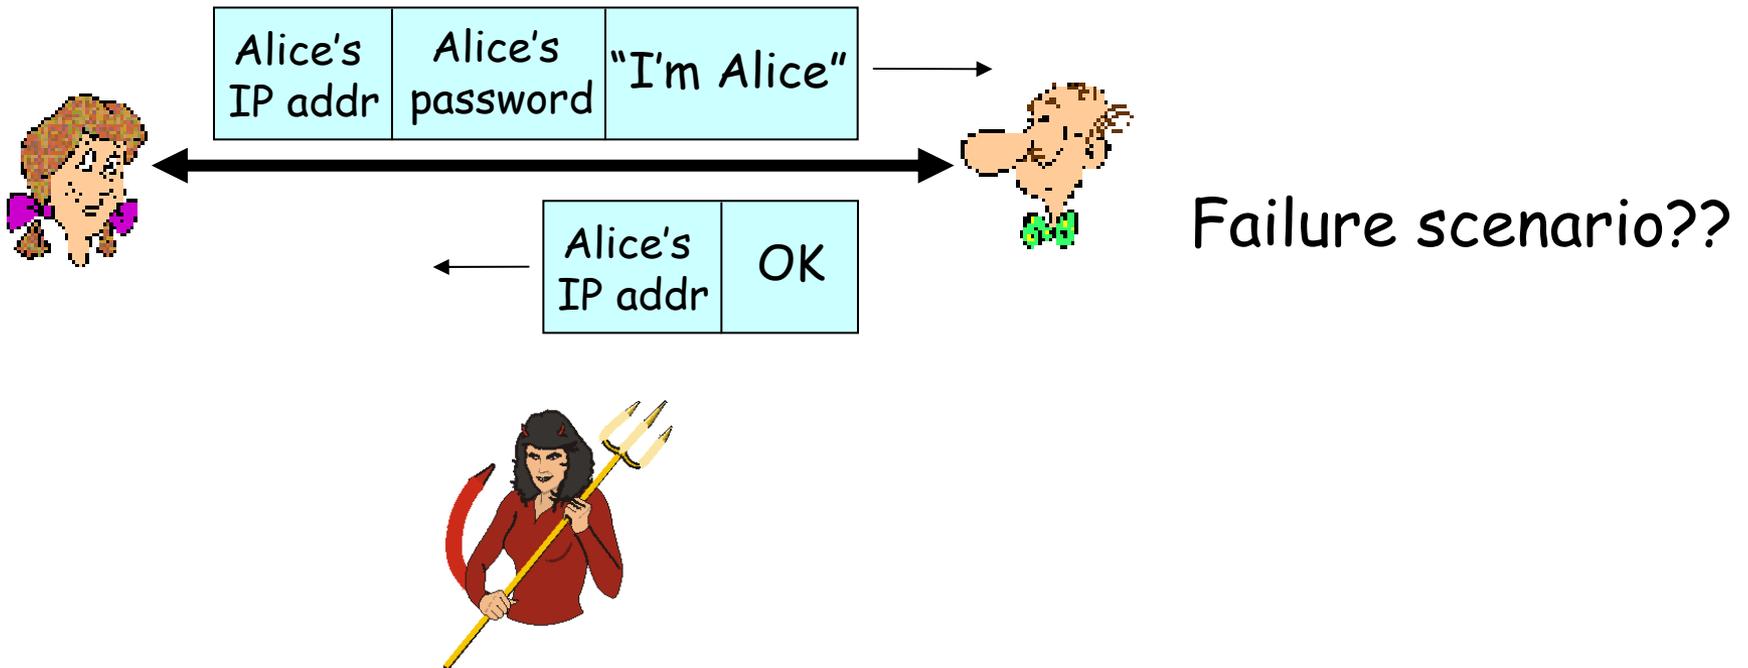

Protocol ap2.0: Alice says "I am Alice" in an IP packet containing her source IP address

Trudy can create a packet "spoofing" Alice's address

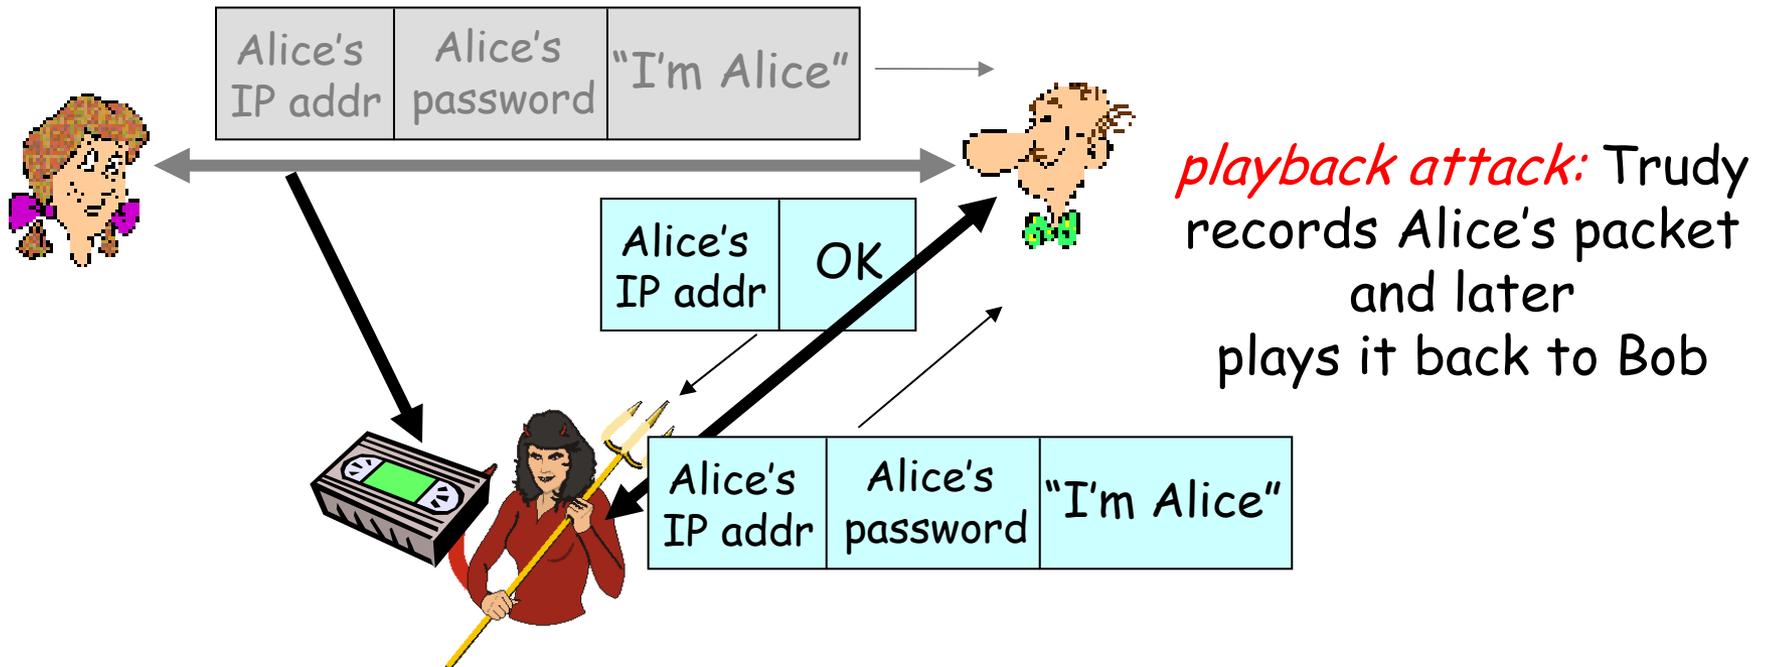

# Authentication: another try

Protocol ap3.0: Alice says "I am Alice" and sends her secret password to "prove" it.

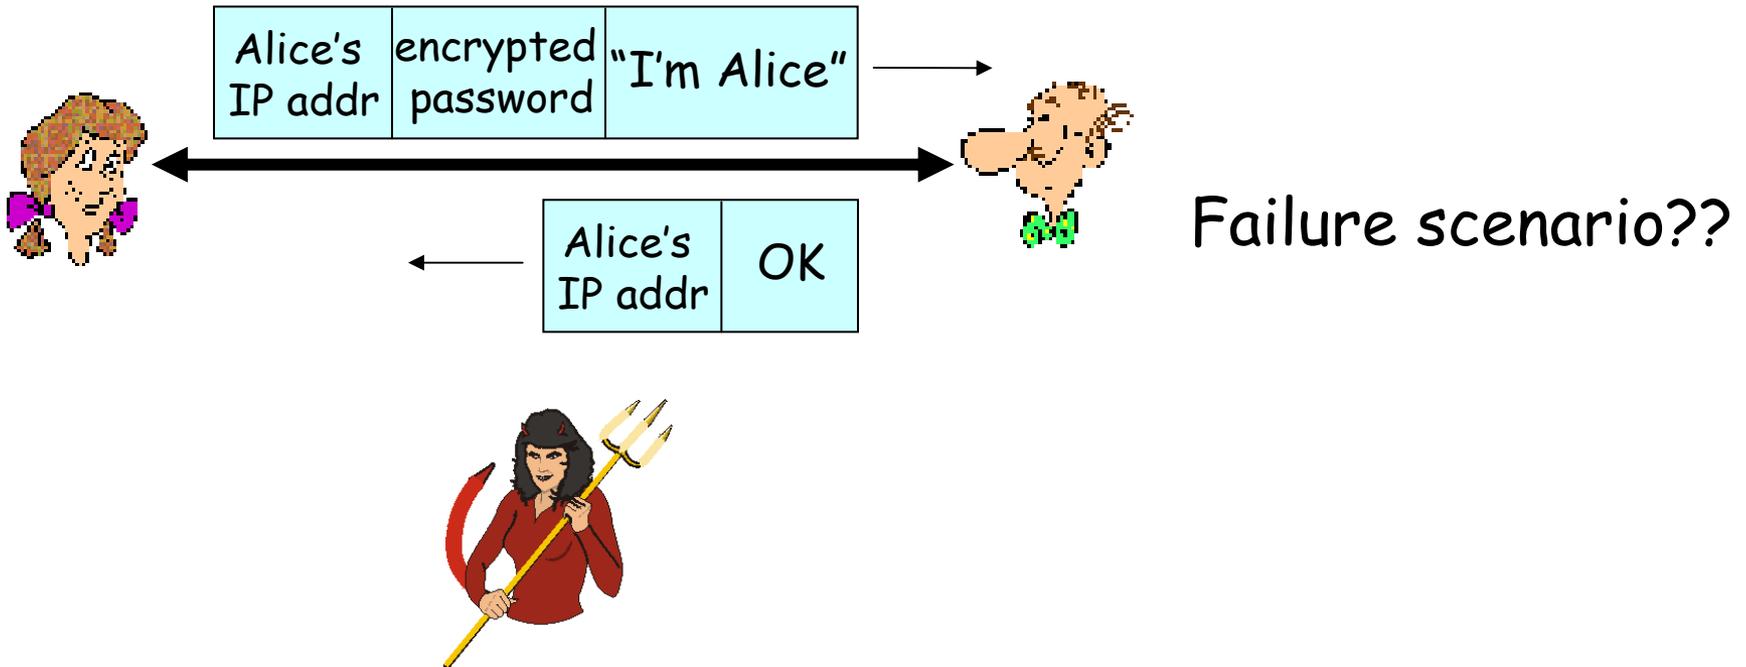

# Authentication: another try

Protocol ap3.0: Alice says "I am Alice" and sends her secret password to "prove" it.

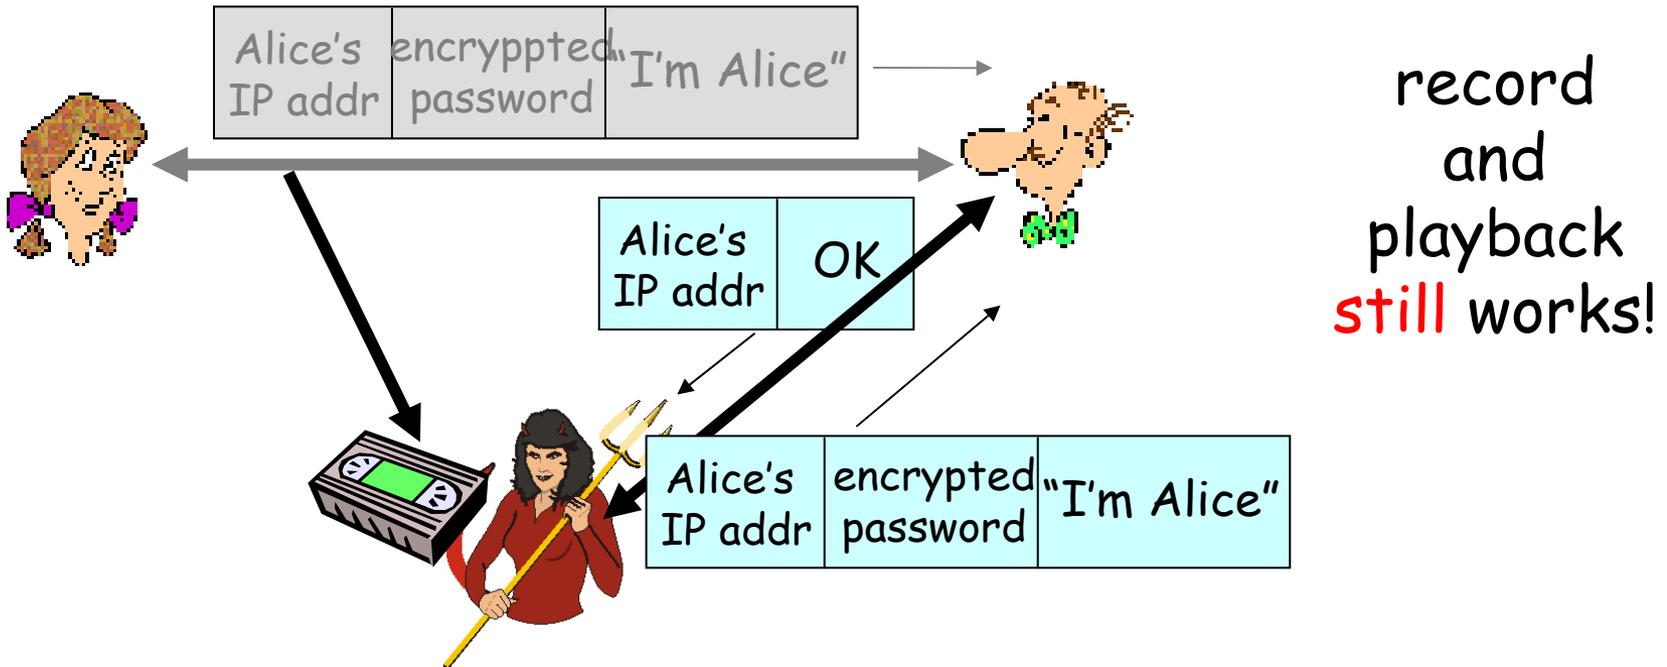

# Authentication: yet another try

Protocol ap3.1: Alice says "I am Alice" and sends her *encrypted* secret password to "prove" it.

# Authentication: another try

Protocol ap3.1: Alice says "I am Alice" and sends her *encrypted* secret password to "prove" it.

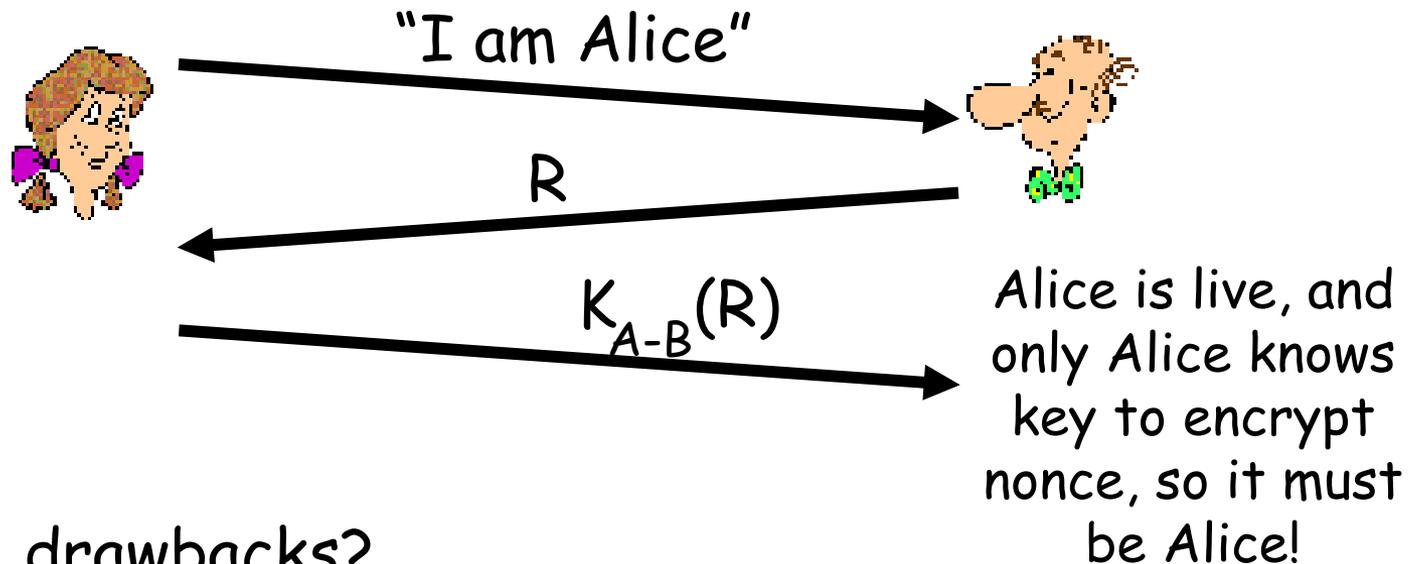

# Authentication: yet another try

Goal: avoid playback attack

Nonce: number (R) used only *once -in-a-lifetime*

ap4.0: to prove Alice "live", Bob sends Alice **nonce**, R. Alice must return R, encrypted with shared secret key

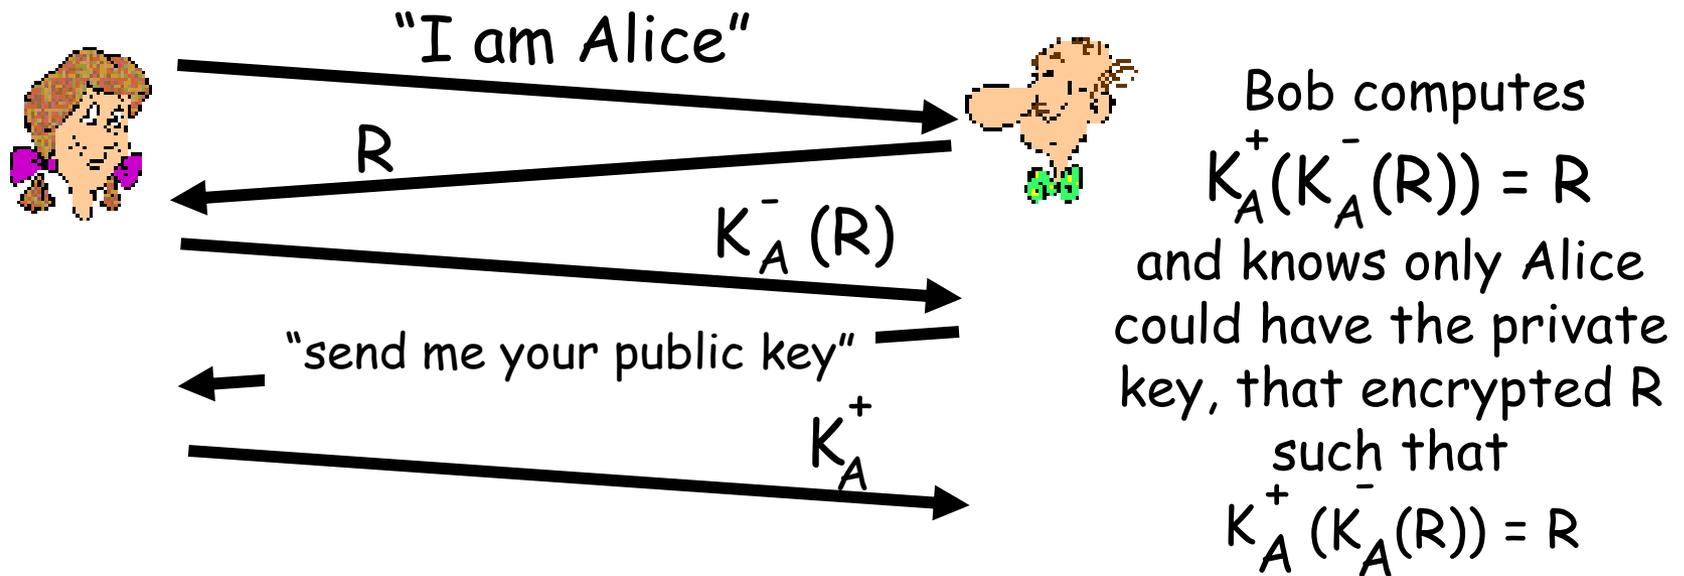

Failures, drawbacks?

# Authentication: ap5.0

ap4.0 requires shared symmetric key

□ can we authenticate using public key techniques?

ap5.0: use nonce, public key cryptography

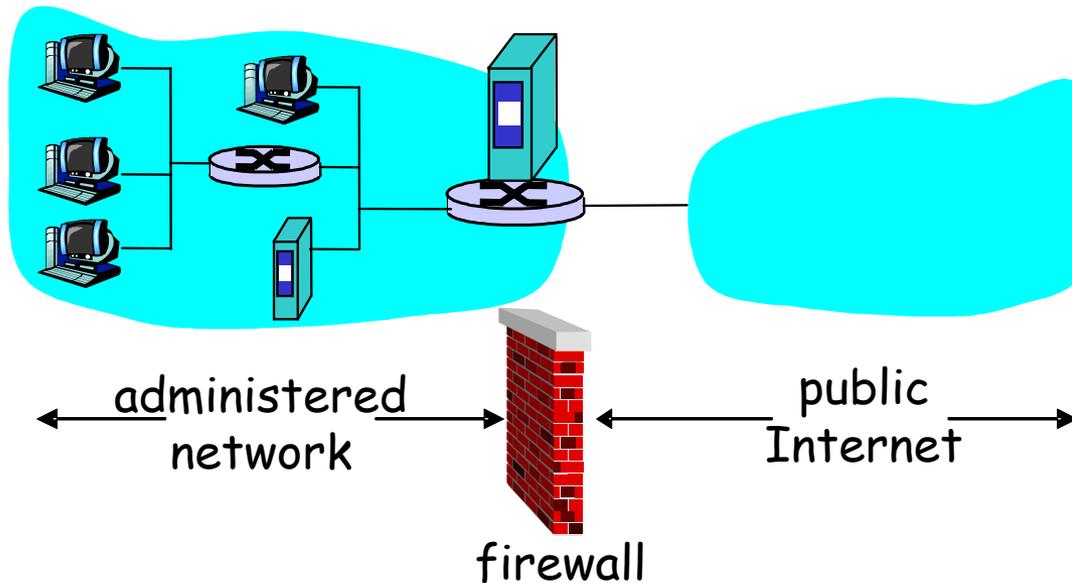

# Overview

- ❑ What is network security?
- ❑ Principles of cryptography
- ❑ Authentication
- ❑ Access control: firewalls
- ❑ Attacks and counter measures

# Firewalls

## firewall

isolates organization's internal net from larger Internet, allowing some packets to pass, blocking others.

# Firewalls: Why

prevent denial of service attacks:

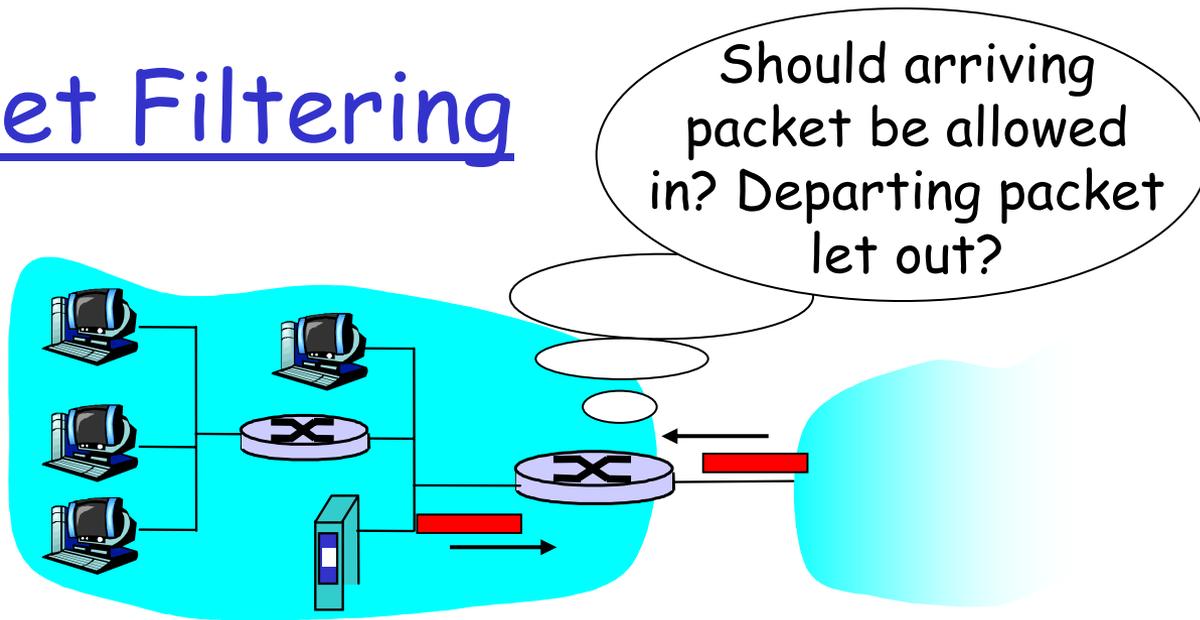

- SYN flooding: attacker establishes many bogus TCP connections, no resources left for "real" connections.

prevent illegal modification/access of internal data.

- e.g., attacker replaces CIA's homepage with something else

allow only authorized access to inside network (set of authenticated users/hosts)

# Packet Filtering

- ❑ internal network connected to Internet via **router firewall**
- ❑ router **filters packet-by-packet**, decision to forward/drop packet based on:
  - source IP address, destination IP address
  - TCP/UDP source and destination port numbers
  - ICMP message type
  - TCP SYN and ACK bits

# Packet Filtering

- Example 1: block incoming and outgoing datagrams with IP protocol field = 17 and with either source or dest port = 23.
  - All incoming and outgoing UDP flows and telnet connections are blocked.

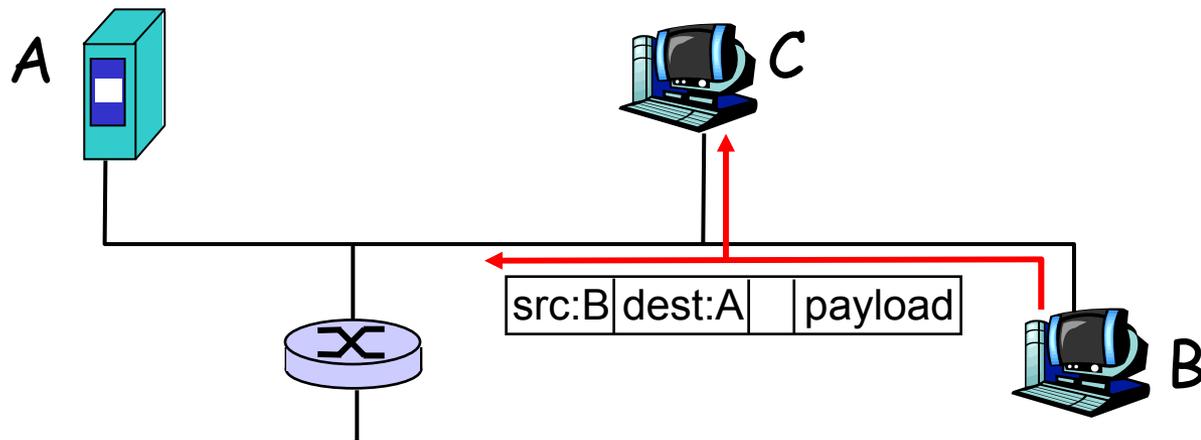

# Overview

- ❑ What is network security?
- ❑ Principles of cryptography
- ❑ Authentication
- ❑ Access control: firewalls
- ❑ Attacks and counter measures

# Internet security threats

## Packet sniffing:

- broadcast media
- promiscuous NIC reads all packets passing by
- can read all unencrypted data (e.g. passwords)
- e.g.: C sniffs B's packets

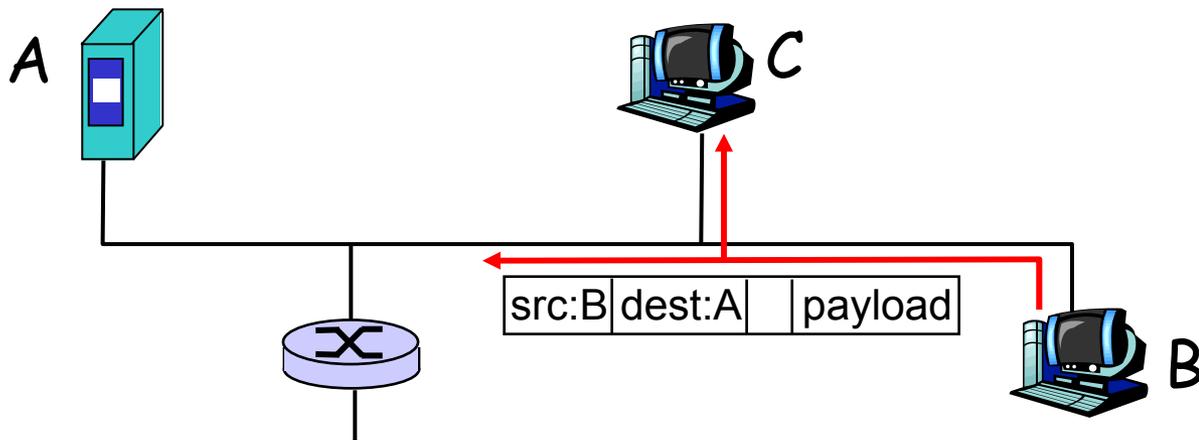

Countermeasures?

# Internet security threats

## Packet sniffing: countermeasures

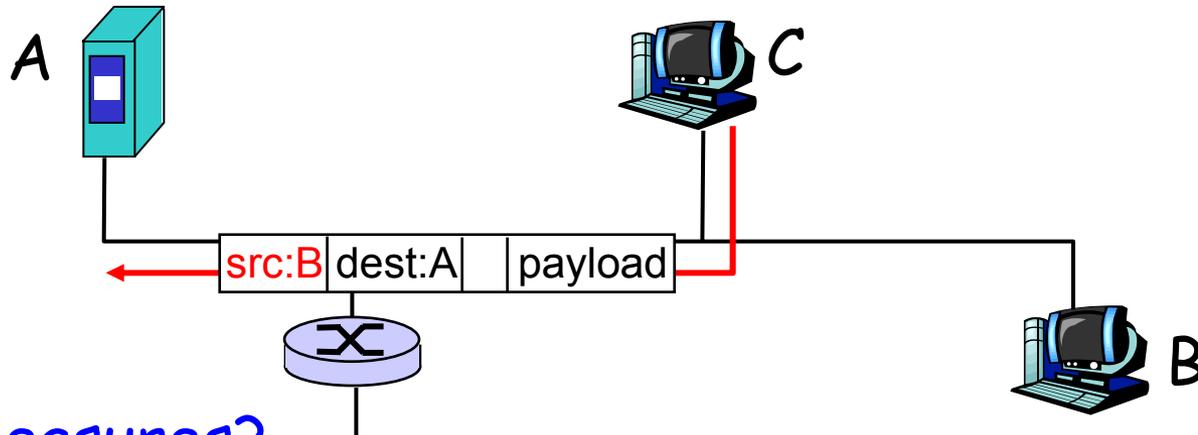

- all hosts in organization run software that checks periodically if host interface in promiscuous mode.
- one host per segment of broadcast media (switched Ethernet at hub)

# Internet security threats

## IP Spoofing:

- can generate "raw" IP packets directly from application, putting any value into IP source address field
- receiver can't tell if source is spoofed
- e.g.: C pretends to be B

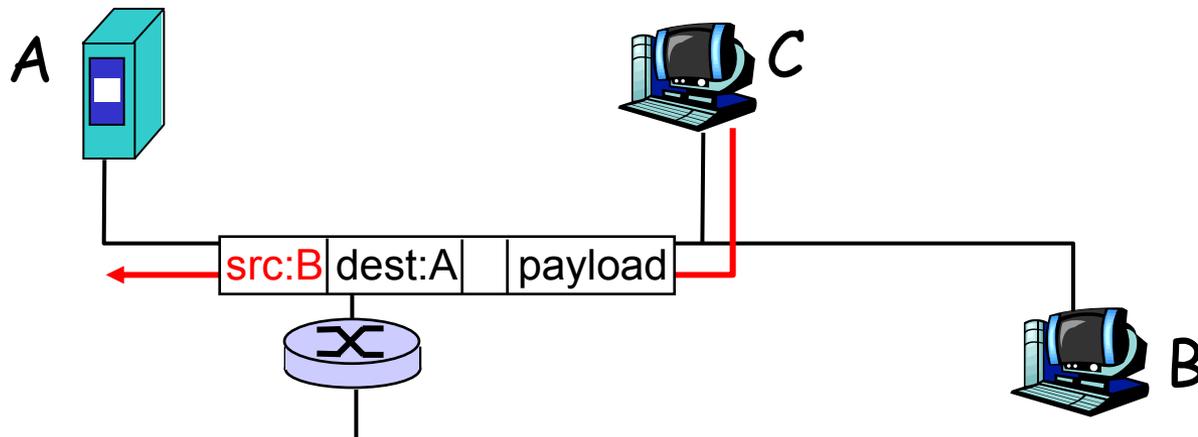

Countermeasures?

# Internet security threats

## IP Spoofing: ingress filtering

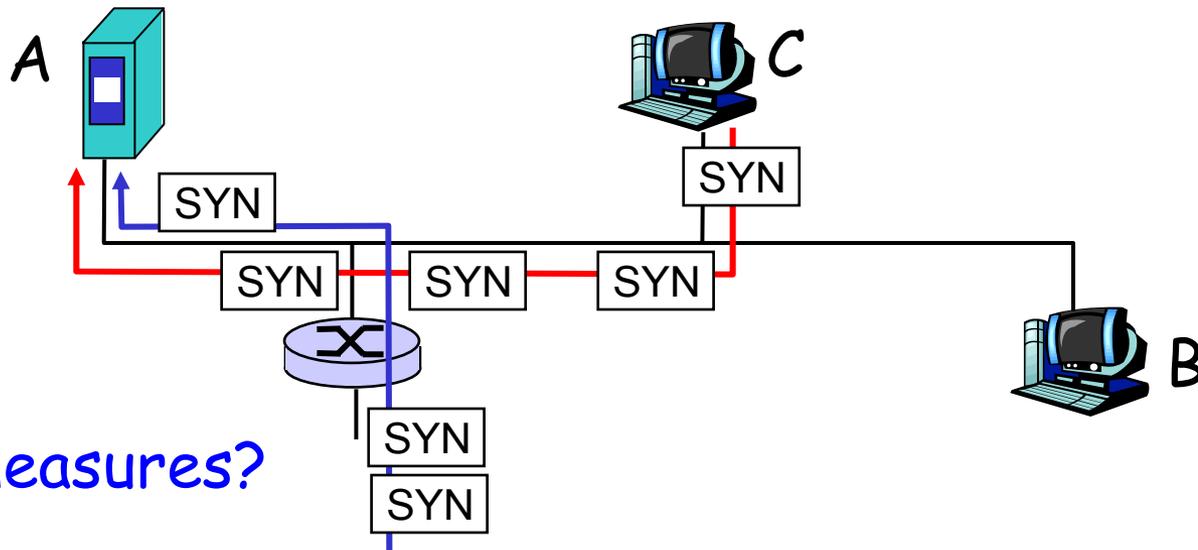

- routers should not forward outgoing packets with invalid source addresses (e.g., datagram source address not in router's network)
- great, but ingress filtering can not be mandated for all networks

# Internet security threats

## Denial of service (DOS):

- flood of maliciously generated packets "swamp" receiver
- Distributed DOS (DDOS): multiple coordinated sources swamp receiver
- e.g., C and remote host SYN-attack A

Countermeasures?

# Internet security threats

## Denial of service (DOS): countermeasures

- filter out flooded packets (e.g., SYN) before reaching host: throw out good with bad
- **traceback** to source of floods (most likely an innocent, compromised machine)
