Study the code below and on the following page. Assume that the correct headers have been included and namespaces specified.

1. There are two mistakes in the code: Vehicle is an abstract class (since it has a pure virtual function), so we cannot instantiate it. The section of the code marked Test 1 should be removed. The second error occurs at the use of printMe(). Its return value is void, so it cannot be used in an expression.
   
   An additional error (in the interface this time) is the lack of a virtual destructor.

2. A Car named Christine is moving
   A Car named Christine is moving
